

TRIODE-PENTODE

FOR VHF CONVERTER APPLICATIONS

DESCRIPTION AND RATING

The 6EH8 is a miniature tube which contains a sharp-cutoff pentode and a triode in one envelope. It is intended primarily for use as a combined triode oscillator and pentode mixer in television receivers. The 6EH8 incorporates a controlled heater-warm-up characteristic.

GENERAL

ELECTRICAL

Cathode—Coated Unipotential			
Heater Voltage, AC or DC	6.3	Volts	
Heater Current	0.45 ± 6%	Amperes	
Heater Warm-up Time*	11	Seconds	
Direct Interelectrode Capacitances			
Pentode Section	With Shield†	Without Shield	
Grid-Number 1 to Plate, maximum	0.012	0.02	μμf
Input	4.8	4.8	μμf
Output	3.2	2.4	μμf
Triode Section			
Grid to Plate	1.8	1.8	μμf
Input	2.8	2.8	μμf
Output	2.2	1.7	μμf
Heater to Cathode	8.5‡	8.5	μμf

MECHANICAL

Mounting Position—Any
Envelope—T-6½, Glass
Base—E9-1, Small Button 9-Pin

MAXIMUM RATINGS

DESIGN-MAXIMUM VALUES	Pentode Section	Triode Section	
Plate Voltage	300	300	Volts
Screen Supply Voltage	300	Volts
Screen Voltage—See Screen Rating Chart			
Positive DC Grid-Number 1 Voltage	0	0	Volts
Plate Dissipation	2.8	2.5	Watts
Screen Dissipation	0.5	Watts
Heater-Cathode Voltage			
Heater Positive with Respect to Cathode			
DC Component	100	100	Volts
Total DC and Peak	200	200	Volts
Heater Negative with Respect to Cathode			
Total DC and Peak	200	200	Volts
Grid-Number 1 Circuit Resistance			
With Fixed Bias	0.25	0.5	Megohms
With Cathode Bias	1.0	1.0	Megohms

Design-Maximum ratings are limiting values of operating and environmental conditions applicable to a bogey tube of a specified type as defined by its published data, and should not be exceeded under the worst probable conditions.

The tube manufacturer chooses these values to provide acceptable serviceability of the tube, taking responsibility for the effects of changes in operating conditions due to variations in tube characteristics.

The equipment manufacturer should design so that initially and throughout life no design-maximum value for the intended service is exceeded with a bogey tube under the worst probable operating conditions with respect to supply-voltage variation, equipment component variation, equipment control adjustment, load variation, signal variation, and environmental conditions.

The tubes and arrangements disclosed herein may be covered by patents of General Electric Company or others. Neither the disclosure of any information herein nor the sale of tubes by General Electric Company conveys any license under patent claims covering combinations of tubes with other devices or elements. In the absence of an express written agreement to the contrary, General Electric Company assumes no liability for patent infringement arising out of any use of the tubes with other devices or elements by any purchaser of tubes or others.

CHARACTERISTICS AND TYPICAL OPERATION

CLASS A₁ AMPLIFIER

	Pentode Section		Triode Section	
Plate Voltage.....	100	125	125	Volts
Screen Voltage.....	70	125	Volts
Grid-Number 1 Voltage.....	0	-1.0	-1.0	Volts
Amplification Factor.....	40	
Plate Resistance, approximate.....	0.17	Megohms
Transconductance.....	6500	6000	7500	Micromhos
Plate Current.....	12	13.5	Milliamperes
Screen Current.....	4.0	Milliamperes
Grid-Number 1 Voltage, approximate				
I _b = 20 Microamperes.....	-10	-9	Volts

* The time required for the voltage across the heater to reach 80 percent of its rated value after applying 4 times rated heater voltage to a circuit consisting of the tube heater in series with a resistance equal to 3 times the rated heater voltage divided by the rated heater current.

† With external shield (EIA 315) connected to cathode unless otherwise noted.

‡ With external shield (EIA 315) connected to ground.
